Card By Phone

Hosted Credit Card Transactions

Card by Phone is a hosted service that lets callers conduct unattended credit card transactions over the phone. A customer can place an order, get card authorization and leave all the details required to fulfil the order in a single call without the need for operator assistance.

Card by Phone is the ideal solution where micro billing by telephone for low value items is required.

Once the phone credit card transaction is complete, data collected from the caller can be transmitted to your order fulfilment systems via Email, Fax or HTTP. Intangible products, such as web content, SMS and MMS messages to mobiles, or downloads via FTP or WAP can be delivered directly using one of X-on's Fulfilment Modules.

Location Independent

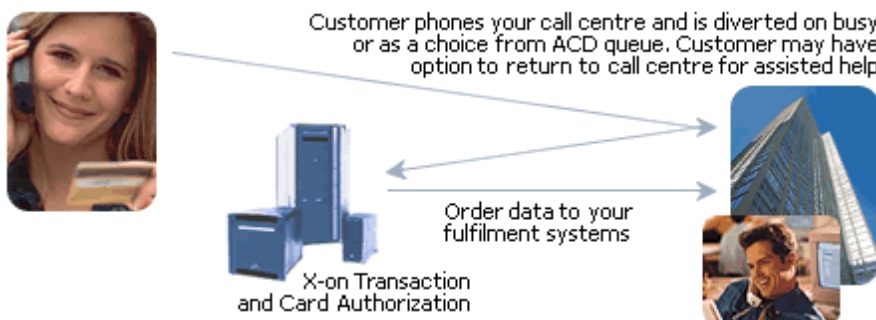

The hosted service means you don't have to invest in costly IVR infrastructure. Charging is transaction based, with the option of a low set-up charge 'standard' service based on product codes, or a customized service that guides the caller through the products or services you offer.

The Card by Phone service can operate on a stand alone number, such as 0800 Freephone or 0870 National Rate, or it can operate as an overflow for an existing call centre, taking orders when peaks of traffic mean callers would otherwise queue or give up.

Stand Alone

Call Centre Overflow

BENEFITS

- Fraction of the cost of operator assisted transaction (less than 5%)
- Reaches a wider range of customers, including mobile users and those without Internet access
- Customer concerns over Internet security allayed
- Merchant account need not be enabled for Internet transactions
- Full checking of AVS (address details) and CV2 (security code) for fraud prevention
- Can operate as stand-alone or as an overflow from attended Call Centre
- Direct link to fulfilment mechanisms for complete unattended self-service

Order Processing

The basic Card By Phone service requires the caller to enter the product code and quantity of each product which they wish to order. A 'product' can be something tangible, such as a book or a CD, or intangible such as access to download software or on-line content. Products can also include information delivered to mobile phones and subscriptions or tickets to events.

Once items have been selected, the system confirms the price, plus any delivery costs and moves on to prompt the customer to enter credit card details, which can include address, postcode and security code information. The credit card transaction takes place while the caller is on the line, and they will get confirmation of whether it has been successful.

Additional information required to complete the order can be gathered. Full delivery name and address can be captured using X-on's NameSpell technology.

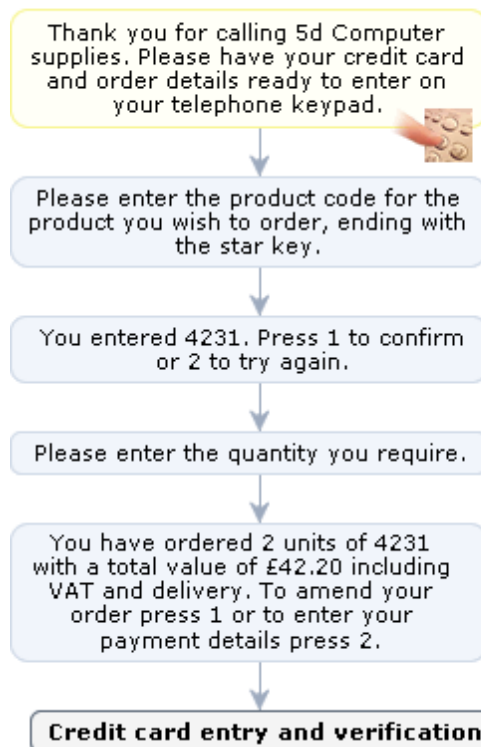

Custom Card By Phone services can prompt callers according to a script you define and can include options to hear additional information and be prompted for products via name rather than product code. The customer can be given the option to abandon the transaction and be forwarded to a live operator for assistance.

Sample Call Flow

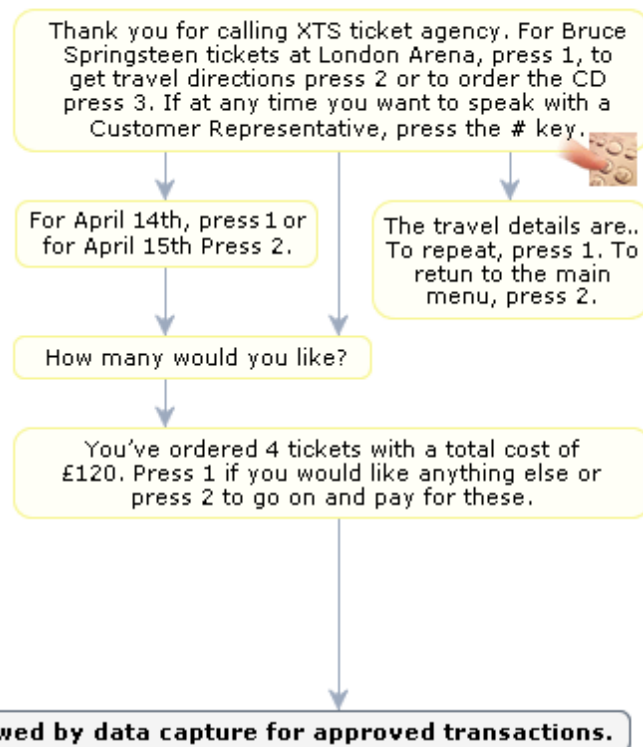

The 'call flow' is the series of messages the caller hears and responds to when calling the Card By Phone service. The options available in the Standard Service can alter this and the Call Flow may be completely altered in the Custom Service.

In the simplified examples below, the messages that can be recorded specifically for your service are coloured **yellow**, the system messages are coloured **blue**.
